## D•Non-divisible 2-3 Power Sums

Every positive integer $\boldsymbol{N}$ can be written in at least one way as a sum of terms of the form (2a)(3b) where no term in the sum exactly divides any other term in the sum. For example:

```
1 = (20)(30)
7 = (22) (30) + (20)(31)
31 = (24)(30) + (20)(32) + (21)(31) = (22) + (33)
```

Note from the example of 31 that the representation is not unique.
Write a program which takes as input a positive integer $\boldsymbol{N}$ and outputs a representation of $\boldsymbol{N}$ as a sum of terms of the form (2a)(3b).

## Input

The first line of input contains a single integer $\mathbf{C},(1 \leq \mathbf{C} \leq 1000)$ which is the number of datasets that follow.

Each dataset consists of a single line of input containing a single integer $\mathbf{N},\left(1 \leq \mathbf{N}<2_{31}\right)$, which is the number to be represented as a sum of terms of the form (2a)(3b).

## Output

For each dataset, the output will be a single line consisting of: The dataset number, a single space, the number of terms in your sum as a decimal integer followed by a single space followed by representations of the terms in the form [ $<2$ exponent>, <3 exponent>] with terms separated by a single space. $<2$ exponent $>$ is the power of 2 in the term and $<3$ exponent $>$ is the power of 3 in the term.

| Sample Input | Sample Output |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 6 |  | 1 | [0,0] |  |  |  |  |  |  |  |
| 1 |  | 2 | $[2,0]$ | [0,1] |  |  |  |  |  |  |
| 7 |  | 3 | $[4,0]$ | [0,2] [ | , 1] |  |  |  |  |  |
| 31 |  | 4 | $[5,5]$ |  |  |  |  |  |  |  |
| 7776 |  | 51 | [0,12] |  |  |  |  |  |  |  |
| $\begin{aligned} & 531441 \\ & 123456789 \end{aligned}$ |  | 68 | [3,13] | [4,12] | $[2,15]$ | $[7,8]$ | $[9,6]$ | [0,16] | $[10,5]$ | [15,2] |
